Curve sketching and analysis y = f(x) must be continuous at each: critical point:  $\frac{dy}{dx} = 0$  or <u>undefined</u>. local minimum :  $\frac{dy}{dx}$  goes (-,0,+) or (-,und,+) or  $\frac{d^2y}{dx^2} > 0$ . local maximum :  $\frac{dy}{dx}$  goes (+,0,-) or (+,und,-) or  $\frac{d^2y}{dx^2} < 0$ . pt of inflection : concavity changes.  $\frac{d^2y}{dx^2}$  goes (+,0,-),(-,0,+), (+,und,-), or (-,und,+)

Basic Derivatives  

$$\frac{d}{dx}(x^n) = nx^{n-1}$$

$$\frac{d}{dx}(\sin x) = \cos x$$

$$\frac{d}{dx}(\cos x) = -\sin x$$

$$\frac{d}{dx}(\tan x) = \sec^2 x$$

$$\frac{d}{dx}(\cot x) = -\csc^2 x$$

$$\frac{d}{dx}(\sec x) = \sec x \tan x$$

$$\frac{d}{dx}(\sec x) = -\csc x \cot x$$

$$\frac{d}{dx}(\ln x) = \frac{1}{x}$$

$$\frac{d}{dx}(e^x) = e^x$$

More Derivatives

$$\frac{d}{dx} (\sin^{-1} x) = \frac{1}{\sqrt{1 - x^2}} \\ \frac{d}{dx} (\cos^{-1} x) = \frac{-1}{\sqrt{1 - x^2}} \\ \frac{d}{dx} (\tan^{-1} x) = \frac{1}{1 + x^2} \\ \frac{d}{dx} (\cot^{-1} x) = \frac{-1}{1 + x^2} \\ \frac{d}{dx} (\sec^{-1} x) = \frac{1}{|x|\sqrt{x^2 - 1}} \\ \frac{d}{dx} (\csc^{-1} x) = \frac{-1}{|x|\sqrt{x^2 - 1}} \\ \frac{d}{dx} (a^x) = a^x \ln a \\ \frac{d}{dx} (\log_a x) = \frac{1}{x \ln a}$$

Differentiation Rules Chain Rule  $\frac{d}{dx} [f(u)] = f'(u) \frac{du}{dx}$   $\frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx}$ Product Rule  $\frac{d}{dx} (uv) = u \frac{dv}{dx} + \frac{du}{dx}v$ Quotient Rule  $\frac{d}{dx} \left(\frac{u}{v}\right) = \frac{\frac{du}{dx}v - u \frac{dv}{dx}}{v^2}$ "PLUS A CONSTANT"

The Fundamental Theorem of Calculus  $\int_{a}^{b} f(x)dx = F(b) - F(a)$ where F'(x) = f(x).

Corollary to FTC  

$$\frac{d}{dx} \int_{a(x)}^{b(x)} f(t)dt = f(b(x)) b'(x) - f(a(x)) a'(x)$$

**Intermediate Value Theorem** If the function f(x) is continuous on [a,b], then for any number c between f(a) and f(b), there exists a number d in the open interval (a,b) such that f(d) = c.

## **Rolle's Theorem**

If the function f(x) is continuous on [a, b], the first derivative exist on the interval (a, b), and f(a) = f(b); then there exists a number x = c on (a, b) such that

f'(c) = 0.

#### Mean Value Theorem

If the function f(x) is continuous on [a, b], and the first derivative exists on the interval (a, b), then there exists a number x = c on (a, b) such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

Theorem of the Mean Value

If the function f(x) is continuous on [a, b] and the first derivative exist on the interval (a, b), then there exists a number x = c on (a, b) such that

$$f(c) = \frac{\int_a^b f(x)dx}{(b-a)}.$$

This value f(c) is the "average value" of the function on the interval [a, b].

Trapezoidal Rule  

$$\int_{a}^{b} f(x)dx = \frac{b-a}{2n} [f(x_{0}) + 2f(x_{1}) + \cdots + 2f(x_{n-1}) + f(x_{n})]$$

Solids of Revolution and friends  

$$\frac{\text{Disk Method}}{V = \pi \int_{a}^{b} [R(x)]^{2} dx}$$

$$\frac{\text{Washer Method}}{V = \pi \int_{a}^{b} ([R(x)]^{2} - [r(x)]^{2}) dx}$$

$$\frac{\text{Shell Method}(\text{no longer on AP})}{V = 2\pi \int_{a}^{b} r(x)h(x)dx}$$

$$\frac{\text{ArcLength}}{L = \int_{a}^{b} \sqrt{1 + [f'(x)]^{2}} dx}$$

$$\frac{\text{Surface of revolution (No longer on AP)}}{S = 2\pi \int_{a}^{b} r(x)\sqrt{1 + [f'(x)]^{2}} dx}$$

## Distance, velocity and acceleration

$$\begin{aligned} \text{velocity} &= \frac{d}{dt} \text{ (position).} \\ \text{acceleration} &= \frac{d}{dt} \text{ (velocity).} \\ \text{velocity vector} &= \left\langle \frac{dx}{dt}, \frac{dy}{dt} \right\rangle. \\ \text{speed} &= |v| = \sqrt{(x')^2 + (y')^2}. \\ \text{Distance} &= \int_{\text{initial time}}^{\text{final time}} |v| dt \\ &= \int_{t_0}^{t_f} \sqrt{(x')^2 + (y')^2} dt \\ \text{average velocity} &= \\ \frac{\text{final position - initial position}}{\text{total time}}. \end{aligned}$$

Integration by Parts  
$$\int u dv = uv - \int v du$$

Integral of Log

 $\ln x dx = x \ln x - x + C.$ 

## **Taylor Series**

If the function f is "smooth" at x =a, then it can be approximated by the  $n^{\rm th}$  degree polynomial

$$f(x) \approx f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x-a)^n.$$

#### Maclaurin Series

A Taylor Series about x = 0 is called Maclaurin. 2 .3

$$e^{x} = 1 + x + \frac{x^{2}}{2} + \frac{x^{3}}{3!} + \cdots$$

$$\cos(x) = 1 - \frac{x^{2}}{2} + \frac{x^{4}}{4!} - \cdots$$

$$\sin(x) = x - \frac{x^{3}}{3!} + \frac{x^{5}}{5!} - \cdots$$

$$\frac{1}{1 - x} = 1 + x + x^{2} + x^{3} + \cdots$$

$$\ln(x + 1) = x - \frac{x^{2}}{2} + \frac{x^{3}}{3} - \frac{x^{4}}{4} + \cdots$$

Lagrange Error Bound If  $P_n(x)$  is the  $n_{\rm th}$  degree Taylor polynomial of f(x) about c and  $|f^{(n+1)}(t)| \leq M$  for all t between x and c, then

$$|f(x) - P_n(x)| \le \frac{M}{(n+1)!} |x - c|^{n+1}$$

Alternating Series Error Bound If  $S_N = \sum_{k=1}^{N} (-1)^n a_n$  is the N<sup>th</sup> partial sum of a convergent alternating series, then

 $|S_{\infty} - S_N| \le |a_{N+1}|$ 

# Euler's Method

If given that  $\frac{dy}{dx} = f(x, y)$  and that the solution passes through  $(x_0, y_0)$ ,  $y(x_0) = y_0$ 

$$y(x_n) = y(x_{n-1}) + f(x_{n-1}, y_{n-1}) \cdot \Delta x$$

In other words:

œ

;

$$x_{\text{new}} = x_{\text{old}} + \Delta x$$
$$y_{\text{new}} = y_{\text{old}} + \frac{dy}{dx}\Big|_{(x_{\text{old}}, y_{\text{old}})} \cdot \Delta x$$

Ratio Test  
The series 
$$\sum_{k=0}^{\infty} a_k$$
 converges if  
 $\lim_{k \to \infty} \left| \frac{a_{k+1}}{a_k} \right| < 1.$   
If limit equals 1, you know nothing.

#### **Polar Curves**

For a polar curve  $r(\theta)$ , the Area inside a "leaf" is

$$\int_{\theta 1}^{\theta 2} \frac{1}{2} [r(\theta)]^2 d\theta,$$

where  $\theta 1$  and  $\theta 2$  are the "first" two times that r = 0. The **slope** of  $r(\theta)$  at a given  $\theta$  is

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta}$$
$$= \frac{\frac{d}{d\theta}[r(\theta)\sin\theta]}{\frac{d}{d\theta}[r(\theta)\cos\theta]}$$

l'Hopital's Rule  
If 
$$\frac{f(a)}{g(a)} = \frac{0}{0}$$
 or  $= \frac{\infty}{\infty}$ ,  
then  $\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)}$ .
