

**Definition:**

1) A function  $f$  is **increasing** on an interval if for any two numbers

$x_1$  and  $x_2$  in the interval,  $x_1 < x_2$  implies \_\_\_\_\_.

2) A function  $f$  is **decreasing** on an interval if for any two numbers

$x_1$  and  $x_2$  in the interval,  $x_1 < x_2$  implies \_\_\_\_\_.

**Test for Increasing and Decreasing Functions**

1) If  $f'(x) > 0$  for all  $x$  in  $(a, b)$ , then \_\_\_\_\_.

2) If  $f'(x) < 0$  for all  $x$  in  $(a, b)$ , then \_\_\_\_\_.

3) If  $f'(x) = 0$  for all  $x$  in  $(a, b)$ , then \_\_\_\_\_.

**First Derivative Test:**

Let  $c$  be a **critical number** of a function  $f$  that is continuous on an open interval  $I$  containing  $c$ .

If  $f$  is differentiable on the interval, except possibly at  $c$ , then  $(c, f(c))$  can be classified as follows.

1) If  $f'(x)$  changes from \_\_\_\_\_ at  $x = c$ , then  $(c, f(c))$  is a \_\_\_\_\_ of  $f$ .

2) If  $f'(x)$  changes from \_\_\_\_\_ at  $x = c$ , then  $(c, f(c))$  is a \_\_\_\_\_ of  $f$ .

Ex. Find the intervals where  $f$  is increasing and decreasing, identify all points that are relative maximum and minimum points, and justify your answers. Use your results to sketch the graph.

(a)  $f(x) = \frac{1}{3}x^3 - x^2 - 3x + 2$

(b)  $f(x) = (x^2 - 4)^{2/3}$

(c)  $f(x) = \frac{x^2}{2x-1}$

Ex. Use the graph of  $f'$  to:

- (a) identify the interval(s) on which the graph of  $f$  is increasing and decreasing;  
(b) estimate the value(s) of  $x$  at which the graph of  $f$  has a relative maximum or minimum.  
Justify your answers.

Graph of  $f'$

Let  $g$  be the function defined by  $g(x) = x^4 + 4x^3$ . How many relative extrema does  $g$  have?

Ex. The function  $s(t) = t^2 - 7t + 10$  describes the motion of a particle along a line.

(a) Find the velocity function of the particle at any time  $t \geq 0$ .

(b) Identify the time interval(s) in which the particle is moving in a positive direction. Justify.

(c) Identify the time interval(s) in which the particle is moving in a negative direction. Justify.

(d) Identify the time(s) at which the particle changes direction. Justify.

### AP Style Practice

1. The function  $y = g(x)$  is differentiable and decreasing for all real numbers. On what intervals is the function  $y = g(x^3 - 6x^2)$  increasing?

2. Let  $f$  be the function given by  $f(x) = 3 - 2x$ . If  $g$  is a function with derivative given by  $g'(x) = f(x)f'(x)(x-3)$ , on what intervals is  $g$  increasing?

3. What are all values of  $x$  for which the function  $f$  defined by  $f(x) = (x^2 - 3)e^{-x}$  is increasing?

$x$	-4	-3	-2	-1	0	1	2	3	4
$g'(x)$	2	3	0	-3	-2	-1	0	3	2

4. The derivative  $g'$  of a function  $g$  is continuous and has exactly two zeros. Selected values of  $g'$  are given in the table above. If the domain of  $g$  is the set of all real numbers, then  $g$  is decreasing on what intervals?

CALCULUS AB

Section 3.4 – Concavity and the 2<sup>nd</sup> Derivative Test

**Definition of Concavity:**

Let  $f$  be differentiable on an open interval  $I$ .

- 1) The graph of  $f$  is **concave upward** on an interval  $I$   
if  $f'$  is \_\_\_\_\_ on the interval.
- 2) The graph of  $f$  is **concave downward** on an interval  $I$   
if  $f'$  is \_\_\_\_\_ on the interval.

**Test for Concavity:**

Let  $f$  be a function whose second derivative exists on an open interval  $I$ .

- 1) If  $f''(x) > 0$  for all  $x$  in  $I$ , then the graph of  $f$  is \_\_\_\_\_ in  $I$ .
- 2) If  $f''(x) < 0$  for all  $x$  in  $I$ , then the graph of  $f$  is \_\_\_\_\_ in  $I$ .

**Definition of an Inflection Point:**

A function  $f$  has an inflection point at  $(c, f(c))$

- 1) if \_\_\_\_\_ **OR** if \_\_\_\_\_ **AND**
- 2) if  $f''$  changes sign from \_\_\_\_\_ or \_\_\_\_\_ at  $x = c$   
**OR** if  $f'(x)$  changes from \_\_\_\_\_ or \_\_\_\_\_ at  $x = c$ .

Ex. The graph of  $f$  is shown below. State the signs of  $f'$  and  $f''$  on the interval  $(0, 3)$ .

Ex. Given the function  $f(x) = x^4 - 4x^3$ , find:

- a) the intervals where  $f$  is increasing and decreasing
- b) the relative extrema
- c) the intervals where  $f$  is concave up and concave down
- d) the inflection points

Justify your answers, and use the information you found to sketch the graph of  $f$ .

---

Ex. Sketch the graph of a continuous function  $f$  with the given characteristics:

(a)  $f(0) = f(2) = 0$

$$f'(x) > 0 \text{ if } x < 1$$

$$f'(1) = 0$$

$$f'(x) < 0 \text{ if } x > 1$$

$$f''(x) < 0$$

(b)  $f(0) = f(2) = 0$

$$f'(x) > 0 \text{ if } x < 1$$

$f'(1)$  is undefined

$$f'(x) < 0 \text{ if } x > 1$$

$$f''(x) > 0$$

Second Derivative Test:

Let  $f$  be a function such that the second derivative of  $f$  exists on an open interval containing  $c$ .

1) If  $f'(c) = 0$  and  $f''(c) > 0$ , then  $f(c)$  is a \_\_\_\_\_ of  $f$ .

2) If  $f'(c) = 0$  and  $f''(c) < 0$ , then  $f(c)$  is a \_\_\_\_\_ of  $f$ .

Ex. Use the Second Derivative Test, if possible, to find the relative extrema of  $f(x) = -3x^5 + 5x^3$ .  
Justify your answer.

---

Ex. Suppose that the function  $f$  has a continuous second derivative for all  $x$ , and that  $f(3) = -4$ ,  $f'(3) = 1$ ,  $f''(3) = -2$ . Let  $g$  be a function whose derivative is given by  $g'(x) = (x^2 - 9)(2f(x) + 5f'(x))$  for all  $x$ . Does  $g$  have a local maximum or a local minimum at  $x = 3$ ? Justify your answer.
